Ver 3.0
**SIPROTEC 4 7VU68**
**MULTI-FUNCTIONAL POWER SUPPLY TRANSFER DEVICE**

**DESCRIPTION**

The reliable and continuous power supply is always a big concern in power system. Permanent availability of electricity is essential for reliable production of a great number of processes in power stations, chemical plants and petrochemical plants, etc. In power utility, e.g., in substation, although no rotating loads are there, the continuous power supply is also required for station service system.

In order to meet this requirement, a busbar is normally equipped with two or more independent in-coming power sources to provide the possibility to switch to standby source in case of main source interruption or failure. This switching-over will be automatically executed by power supply transfer device in short time.

The device SIPROTEC 4 7VU68 is specially designed for this application. Based on the existing world-wide used SIPROTEC 4 platform, the reliability, stability and efficiency are guaranteed. Thanks to its powerful and flexible performance, the device integrates all functions in one system, i.e., transfer function, protection and supervision.

The device 7VU68 has two individual categories of HSBT 7VU683 and ATS 7VU681. 7VU683 is designed for high speed busbar transfer system while 7VU681 for low speed automatic transfer system. Then, 7VU68 can serve for all switching-over applications of power stations, industrial plants and power utility.

Also, the application scope is largely extended by the hardware and software design. It fits for the primary connections of single busbar and segmented single busbar. The easy-to-use concept is characterized by the pre-defined and configured settings and large graphic LCD display.

The integrated protection functions are to be implemented in segmented single busbar connection, where tie-CB is to be protected against short-circuit and earth fault.

The integrated supervision function is to monitor the voltage phase sequence of busbar and voltage secondary circuit of both busbar and line, then gives out alarm in case of failure.

The integrated programmable logic (CFC) allows the users to implement their own functions. User-defined messages can be generated as well. The flexible communication interfaces are open for...
modern communication architectures with remote control center.

**Transfer Functions**

- High speed transfer of category HSBT 7VU683, with high speed relay contact for CB closing (only 1ms).
- Low speed transfer of category ATS 7VU681

**Protection Functions**

- Phase O/C Protection
- Earth O/C Protection
- Phase O/C Protection for Busbar Energization
- Earth O/C Protection for Busbar Energization

**Supervision Functions**

- Self-supervision of the device
- Oscillographic fault recording
- Voltage phase sequence of busbar
- Voltage circuit monitoring of busbar and line

**Communication Interfaces**

- PC front port for DIGSI setting, RS232
- System Interface port B
  - IEC 60870-5-103, ST / RS485
  - IEC 60870-5-103, double RJ45
  - IEC 61850, Ethernet, double LC / RJ45
  - Modbus, ST / RS485
  - Profibus-DP, ST / RS485
- Rear service port C for remote DIGSI setting
- Time synchronization port A – DCF 77/IRIG B

**Language Support**

- English
- Chinese

**TYPICAL APPLICATIONS**

The device 7VU68 is subject to the below typical utilizations of power generation, power utility and industry in the whole energy chain.

**Fig.3  Energy chain**

APPLICATION 1
HIGH SPEED TRANSFER - HSBT 7VU683

For the auxiliary power supply of power stations and certain industrial plants a safe medium voltage supply is extremely important especially for rotating loads. In case of one source interruption or failure, it's required to quickly and safely transfer the power supply to another source. In order to ensure this, such medium voltage busbars are installed with two or more independent incoming feeders to automatically change the source of the power supply via automation device, if necessary.

Such kind of automation equipment to secure the quick and safe transfer of sources is called as High Speed Busbar Transfer device (HSBT). Siemens is very early involved and has tens-year long and experienced history in this field. The technical leading solution type AUE series are now world-widely used in power stations and industrial plants.

The category HSBT 7VU683 of Power Supply Transfer device 7VU68 is a compact solution based on type AUE series. It has incorporated the latest concepts on high speed transfer, i.e, various starting conditions, switching sequences and transfer modes. Additionally, the protection functions for tie-CB in application Segmented Single Busbar and the supervision functions for voltage circuit are integrated.

Starting Conditions

The category HSBT 7VU683 is designed to support the following starting conditions,

- NORMAL condition
- FAULT condition
- Inadmissible Under-voltage condition
- Inadmissible Under-frequency condition
- Inadvertent CB Open condition

The above conditions can be freely combined together, i.e, one of them can be individually switched “OFF”.

- NORMAL condition

Under the NORMAL condition, the power system is fault free and the starting command must be manually issued. This command can come from remote control center and/or local controller via wiring connection or communication over protocol, e.g,

- DCS of power station
- Turbine control system
- Local panel

The switching of remote and local starting authority is done by internal CFC logic and controlled by device switching key “Remote/Local”. The starting command can only be remotely executed over communication when the switching key is at position “Remote”, vice versa.

- FAULT condition

Under the FAULT condition, power system fault must be there on the in-feeder line and the starting command must be externally issued by other device, e.g, protection device.
Abnormal condition

Under the abnormal condition, voltage disturbance must be there on the busbar due to any causes. The starting command can be internally issued by device HSBT 7VU683 according to the following abnormal conditions,

- Inadmissible Under-voltage
- Inadmissible Under-frequency
- Inadvertent CB Open

To secure the starting reliability, line current is used as the additional criterion to the above conditions.

In case the operating CB is manually tripped, transfer must not be started. This can be recognized via indication 17864 ">NonManu.Op.CB1" and 17865 ">NonManu.Op.CB2" in configuration matrix.

Switching Sequences

The category HSBT 7VU683 is designed to serve for the following switching sequences according to CBs’ operating behavior,

- PARALLEL switching sequence
- SIMULTANEOUS switching sequence
- SEQUENTIAL switching sequence

PARALLEL and SIMULTANEOUS switching sequences can exclusively support the starting condition NORMAL while SEQUENTIAL can support all starting conditions.

PARALLEL switching sequence

If the two sources are allowed to work on busbar in parallel for a short time, the PARALLEL sequence can be used for power supply transfer.

Under PARALLEL sequence, HSBT 7VU683 will firstly issue a CLOSE command to the to-be-closed CB after the device get the starting command. When the closure is successful, the device will trip the to-be-opened CB. The tripping command can be automatically generated by device or derived from manual operation which are dependent on setting,

- PARALLEL Auto sequence
- PARALLEL Half-Auto sequence

Under PARALLEL Auto sequence, the device will not issue the OPEN command until the Manual Open command arrived. The criterions are as below,

- \( df < 8851 \) “PARAL. Delta f”
- \( |dU| < 8852 \) “PARAL. Delta U”
- \( d\phi < 8853 \) “PARAL. Delta PHI”

If the to-be-opened CB failed to open, the device will automatically de-couple the to-be-closed CB.

The time sequence under PARALLEL can be understandable via the below figure (assumed switching of closing CB2 and opening CB1),

PARALLEL Half-Auto sequence, the device will not issue the OPEN command until the Manual Open command arrived. The criterions are as below,

- \( df < 8851 \) “PARAL. Delta f”
- \( |dU| < 8852 \) “PARAL. Delta U”
- \( d\phi < 8853 \) “PARAL. Delta PHI”

The advantage of PARALLEL sequence is to avoid any interruption of busbar power supply. PARALLEL Auto sequence should be preferred to reduce the overlapping time of two sources.
SIMULTANEOUS switching sequence

If the two sources are not allowed to work on busbar in parallel, the SIMULTANEOUS sequence can be used for power supply transfer.

PARALLEL and SIMULTANEOUS switching sequences, SEQUENTIAL sequence can only issue CLOSE command after the opening succeeded.

The time sequence under SEQUENTIAL can be understandable via the below figure (assumed switching of closing CB2 and opening CB1),

---

Sequential switching sequence

Under SEQUENTIAL sequence, HSBT 7VU683 will firstly issue a OPEN command to the to-be-opened CB after the device get the starting command. Differentiate from

---

Transfer Modes

In the station service system of power station and industrial plants, lots of asynchronous motors are connected. In case of the main source interruption, the residual voltage of busbar will be induced by connected asynchronous motors. Fig.10 shows the well-known typical diagram of vector trajectory of residual voltage.
Some notes are there regarding curve A according to Fig.10. The amplitude and frequency of residual voltage will decrease regarding time, while the delta phase angle against referred voltage will increase. Fig.11 gives more messages to differential voltage.

The equivalent circuit of residual voltage $U_{res}$ and referred voltage $U_{ref}$ is shown in Fig.11.

The voltage drop on motor $U_m$ at instant of CB closing is calculated by following,

$$U_m = \frac{dU \cdot x_m}{(x_m + x_s)} = k \cdot dU \quad (\text{Equa.-1})$$

Here, $x_m$ and $x_s$ are respectively the equivalent reactance of busbar loading and referred system.

For safety reason, the value $|U_m|$ must not exceed the permissible voltage $k_{ov} \cdot |U_n|$. Then, the maximum of permissible differential voltage $|dU|_{max}$ will be,

$$|dU|_{max} = \frac{k_{ov}}{k} \cdot |U_n| \quad (\text{Equa.-2})$$

In case $k_{ov} = 1.1$ and $k = 0.67$, the calculated $|dU|_{max}$ should be less than 1.64$\cdot |U_n|$ (refer to curve B in Fig.10). In case $k_{ov} = 1.1$ and $k = 0.95$, the calculated $|dU|_{max}$ should be less than 1.15$\cdot |U_n|$ (refer to curve C in Fig.10). This calculation result would be the base for setting.

The plane is divided into two parts by curve B (or curve C). The left is defined as un-safe area because the value $|dU|$ is bigger than the up-limit $|dU|_{max}$ which could damage the winding of stator. Vice versa, the right is safe area.

Based on the above principles, the category HSBT 7VU683 is designed to have the following modes (refer to Fig.10) to fit for the safe transfer,

- FAST transfer mode (area I)
- REAL-TIME FAST transfer mode (area II and IV)
- IN-PHASE transfer mode (area V)
- RES-VOLT transfer mode
- LONG-TIME transfer mode
All of above modes can be freely combined together, i.e., one of them can be individually switched “ON” or “OFF” remotely via communication or locally at device panel.

To be noted that the original $\phi$ and $|dU|$ between busbar voltage and standby voltage due to wiring can be automatically compensated by device during configuration.

- **FAST** transfer mode

  The study and testing results show, in most cases the typical values of $df$, $\phi$ and $|dU|$ are smaller enough within the first tens of millisecond from the instant the CB opens. It’s good to safe and fast transfer due to the slight shock to motors. If the real-time measured $df$, $\phi$ and $|dU|$ meet the defined criterions, the device will immediately issue the CLOSE command to the to-be-closed CB. The criterions are as below,

  - $df < 8858$ "FT Delta f"
  - $\phi < 8859$ "FT Delta PHI"
  - $|Ures| > 8860$ "FT U/V BLK"

  The typical operating time of 7VU683 in this case is approx.20ms. As modern vacuum breaker has less making time, e.g, 60ms, the dead time of busbar will be as short as approx.80ms.

- **REAL-TIME FAST** transfer mode

  When FAST transfer chance is missed, the device will automatically, if activated, turn to next transfer mode REAL-TIME FAST. This mode has more concerning on the permissible motor voltage, i.e, the differential voltage $|dU|$ across the opened CB must not exceed the value $|dU|_{max}$. The intelligent device 7VU683 then estimates the delta phase angle $\phi$ and differential voltage $dU$ at the instant the CB closes based on real-time slipping rate and the settable “CBx Closing Time”. If all the quantity of predicted $\phi$, the real-time $df$ and $|Ures|$ meet the defined criterions, the device will immediately issue the CLOSE command to the to-be-closed CB. The criterions are as below,

  - $df < 8861$ "IN-PHA Delta f"
  - $\phi < 8862$ "IN-PHA Delta PHI"
  - $|Ures| > 8870$ "IN-PHA U/V BLK"

- **RES-VOLT** transfer mode

  If the above mentioned transfer modes failed, the transfer can still go on with mode RES-VOLT. When the residual voltage $|Ures|$ under-shots the settable parameter 8871 “RES-VOLT Threshold”, the RES-VOLT transfer mode will perform and the device will immediately issue the CLOSE command to the to-be-closed CB. The typical setting could be 30%Un. To reduce the shock under low voltage restarting of motors, two stages of Low Voltage Load-Shedding (LVLSH) function are integrated in the device. LVLSH will pickup before the RES-VOLT transfer mode. This function can be activated or de-activated manually on site.

- **LONG-TIME** transfer mode

  The last criterion to start the transfer is LONG-TIME mode if all above mentioned modes failed.
When the transfer time is more than the settable parameter 8872 “LONG-TIME Threshold”, the LONG-TIME transfer mode will perform and the device will immediately issue the CLOSE command to the to-be-closed CB. The typical setting could be 3s.

Sample of Oscillographic Transfer Record - FAST Transfer Mode

![Waveform record of FAST transfer at segmented single busbar](image1)

**Fig.13** Waveform record of FAST transfer at segmented single busbar

![Event log of FAST transfer at segmented single busbar](image2)

**Fig.14** Event log of FAST transfer at segmented single busbar

Some notes to Fig.13 and Fig.14,

- Fault is there in Line1 and cleared by protection relay. Meanwhile, HSBT is started
- Switching-over between Line1 and Line2 are defined
- Instant 0ms, device picked up, CommandOpenCB1 issued
- Instant 12ms, CB1 opened
- Instant 26ms, CommandCloseCB2 issued
- Instant 62ms, CB2 closed
- FAST transfer succeeded, approx. 50ms dead time interval of busbar

- Primary connection of segmented single busbar
- Line1 in operating while Line2 in standby, CB3 serve as tie-CB which is in closed status
The device HSBT 7VU683 will automatically determine the switching direction based on the actual CBs’ status.

The above switching-overs can be individually switched“ON” or “OFF” remotely via communication or locally at device panel.
Primary connection of segmented single busbar: CB1 and CB3 are closed, CB2 is opened.

In case of these CBs' status, two possible switching directions are there. Then, the starting command of two switching directions must be externally separately routed to device's binary inputs, e.g., starting command L1→L2 routed to BI13, B2→L2 to BI12. The device will properly execute the switching direction based on the command input under this case.

The above switching-overs can be individually switched "ON" or "OFF" remotely via communication or locally at device panel.
Primary connection of segmented single busbar: CB2 and CB3 are closed, CB1 is opened

In case of these CBs’ status, two possible switching directions are there. Then, the starting command of two switching directions must be externally separately routed to device’s binary inputs, e.g, starting command B1->L1 routed to BI13, L2->L1 to BI12. The device will properly execute the switching direction based on the command input under this case.

Starting command B1->L1 can be designated to BI13 too even if starting command L1->L2 is already there, the reason is only one of these two switching directions will be automatically executed by device based on the actual CBs’ status. The same situation applies to L2->L1.

The above switching-overs can be individually switched “ON” or “OFF” remotely via communication or locally at device panel.
In case of these CBs’ status, two possible switching directions are there. Then, the starting command of two switching directions must be externally separately routed to device’s binary inputs, e.g., starting command B1->B2 routed to BI13, B2->B1 to BI12. The device will properly execute the switching direction based on the command input under this case.

Starting command B1->B2 can be designated to BI13 too even if starting command L1->L2 and B1->L1 are already there, the reason is only one of these three switching directions will be automatically executed by device based on the actual CBs’ status. The same situation applies to B2->B1.

The above switching-overs can be individually switched “ON” or “OFF” remotely via communication or locally at device panel.
Summary of Switching Directions

The device supports bi-direction power transfer under NORMAL condition, i.e., the device can transfer the main source of busbar to standby depending on the actual CBs’ status, vice versa.

In most cases, the switching is limited from main source to standby source under starting conditions of FAULT, Inadmissible Under-voltage, Inadmissible Under-frequency and Inadvertent CB Open. The requirement can be met by setting the parameter 8831 “Mono-direction against NORMAL condition” = “YES”. The default setting “YES” can be changed to “NO” if bi-direction transfer is always required in any conditions.

To be noted that power supply 1 is exclusively defined as main source while power supply 2 defined as standby source. Then, if mono-direction against NORMAL condition is required, power supply 1 in Fig.15~Fig.22 should be identified as main source.

The transfer permission under various starting conditions and switching directions can be referred to below two tables.

HSBT Test Mode

To facilitate the functional testing and site commissioning, the Test Mode is specially designed for this purpose. This function can be activated on site by parameter setting 8820 “HSBT Test Mode” = “Yes” or by indication 18020 “HSBT Test Mode” via binary input.

If the function HSBT goes into Test Mode, the transfer process is the same except that the CLOSE command will be blocked. Instead, CLOSE command with test mark will be issued for indicating.

HSBT Test Mode could be helpful before the device is put into service. When CB is manually tripped, HSBT 7VU683 picks up and goes into transfer process. Under the assistance of integrated Fault Recorder and Event Log, the operating consequence and settings can be assessed. Optimization to parameter settings can be done based on the assessment.

Reset of Transfer

The default setting is to block the device after once transfer is executed, i.e., either failure or success, the device goes into blocking status till to the reset indication via binary input or LED button on device panel. This can be changed by setting the parameter 8817 “Manual Restart HSBT” = “NO”. Then, after once successful transfer, the device will automatically execute a new transfer request before the reset indication arrives. But, after once failed transfer, the device will go into blocking status till to the reset indication.
APPLICATION 2
LOW SPEED TRANSFER - ATS 7VU681

In some applications, e.g., hydro power station or substation, the continuous power supply is required for station service system in case of power supply failure. The transfer time is not critically assessed for non-rotating loads.

To support the automatic and smooth transfer of sources, the called Automatic Transfer System (ATS) is necessary. The ATS can be realized by intelligent electronic devices (IEDs) installed at MV switchgears via programmable logic. Siemens now provide the compact solution, that is, integrates all necessary measurements, logic binary inputs, binary outputs and wiring into one device ATS 7VU681.

The category ATS 7VU681 of Power Supply Transfer device 7VU68 is designed to support broad applications under the easy-to-use concept. Additionally, the protection functions for tie-CB in application Segmented Single Busbar and the supervision functions for voltage circuit are integrated.

General

The pre-condition to ATS starting is that the device is in Ready status, i.e., the standby source is live, the relative CBs’ status is proper, no external blocking indication is there, etc. Oppositely, the device will go into blocking status and any transfer request will be rejected.

The starting of ATS will be internally and automatically executed by device 7VU681 based on the settable parameters. The main criterions are referred to the line voltage and busbar voltage. To secure the starting reliability, line current is used as the additional criterion.

In case the operating CB is manually tripped, transfer must not be started. This can be recognized via indication 17864 “>NonManu.Op.CB1” or 17865 “>NonManu.Op.CB2” in configuration matrix.

If one transfer is executed, either failure or success, the device goes into blocking status till to the reset indication via binary input or LED button on device panel. This can be changed by setting the parameter 0231 Manual Restart ATS = ”NO”, then, after once successful transfer, the device will automatically execute a new transfer request before the reset indication arrives. But, after once failed transfer, the device will go into blocking status till to the reset indication.

The device ATS 7VU681 has pre-configured eight transfer modes, see Fig.23~Fig.36. Each of them can be individually switched “ON” or ”OFF” remotely via communication or locally at device panel. If other transfers are required, device integrated programmable logic CFC can be practical.

Load-Shedding

If standby transformer has smaller capacity than main transformer, the overloading of the standby transformer could be there after the completion of transfer. Rejecting some loads will be helpful. The integrated Load-Shedding function is specially designed for this utilization.

To over-shot the line current will cause the pickup of Load-Shedding. Depends on the transfer mode, the device will automatically determine which line current will be used.

The function Load-Shedding can be individually activated or de-activated under each transfer mode. It has one stage with two time delays, each time delay can be separately configured to binary output to fit for various load-shedding’ plans.

Load-Shifting

In some complex primary connection (see Fig.35), switching will perform among multi-CBs. If the overloading of the standby transformer must be there after the completion of transfer, shifting some loads to other busbar will be helpful. The integrated Load-Shifting function is specially designed for this utilization.

This function can be individually switched “ON” or “OFF” remotely via communication or locally at device panel.
Transfer Modes and Wiring Diagrams

- Primary connection of segmented single busbar: CB1, CB3, CB4 and CB5 are closed, CB2 is opened

![Diagram of power supply transfer device](Image)

Basic criterions to **Ready** status, “AND” logic:
- CB1 and CB3 in closing status, CB2 in opening status
- \( U_{B1} > 8900 \) “Busbar Live Voltage Threshold”
- \( U_{B2} > 8900 \) “Busbar Live Voltage Threshold”
- \( U_{xL2} > 8902 \) “Line Live Voltage Threshold”

If 0214 “PT Connection L2” = “Not connected”, then L2 will be seen as live.

Basic criterions for ATS pickup, “AND” logic:
- \( U_{B1} < 8901 \) “Busbar Dead Voltage Threshold”
- \( U_{B2} < 8901 \) “Busbar Dead Voltage Threshold”
- \( I_{xL1} < 8904 \) “Line Dead Current Threshold”
- \( U_{xL2} > 8902 \) “Line Live Voltage Threshold”

The transfer will be immediately terminated as soon as the device goes into **Un-Ready** status. Basic criterions are as below, “OR” logic:
- CB1 in opening status
- CB3 in opening status
- \( U_{B1} > 8900 \) “Busbar Live Voltage Threshold”
- \( U_{B2} > 8900 \) “Busbar Live Voltage Threshold”
- Dropout of \( U_{xL2} > 8902 \) “Line Live Voltage Threshold”

Operating consequence, see Fig.24

- \( U_{B2} > 8900 \) “Busbar Live Voltage Threshold”
- Dropout of \( Ux_{L2} > 8902 \) “Line Live Voltage Threshold”

Operating consequence, see Fig.32

---

Fig.31  Switching-over T1->T2

Fig.32  Operating consequence T1->T2
Primary connection of segmented single busbar: CB2, CB3 and CB5 are closed, CB1 and CB4 are opened

Fig.33  Switching-over T2->T1

Basic criterions to Ready status, “AND” logic
- CB2 and CB3 in closing status, CB1 in opening status
- U_B1 > 8900 “Busbar Live Voltage Threshold”
- U_B2 > 8900 “Busbar Live Voltage Threshold”
- Ux_L1 > 8902 “Line Live Voltage Threshold”

If 0213 “PT Connection L1” = “Not connected”, then L1 will be seen as live.

Basic criterions for ATS pickup, “AND” logic
- U_B1 < 8901 “Busbar Dead Voltage Threshold”
- U_B2 < 8901 “Busbar Dead Voltage Threshold”
- Ix_L2 < 8904 “Line Dead Current Threshold”
- Ux_L1 > 8902 “Line Live Voltage Threshold”

Operating consequence, see Fig.34

The transfer will be immediately terminated as soon as the device goes into Un-Ready status. Basic criterions are as below, “OR” logic
- CB2 in opening status
- CB3 in opening status
- U_B1 > 8900 “Busbar Live Voltage Threshold”
- U_B2 > 8900 “Busbar Live Voltage Threshold”
- Dropout of Ux_L1 > 8902 “Line Live Voltage Threshold”

Fig.34  Operating consequence T2->T1
Primary connection of segmented single busbar: CB1, CB2, CB4, CB5 and CB6 are closed, CB3 and CB7 are opened.

Fig. 35  Switching-over B1->B2 with Load-Shifting

- Basic criterions to Ready status, “AND” logic
  - the same as Fig.27
- Basic criterions for ATS pickup, “AND” logic
  - the same as Fig.27
- The transfer will be immediately terminated as soon as the device goes into Un-Ready status. Basic criterions are as below, “OR” logic
  - the same as Fig.27
- Operating consequence, see Fig.36

PROTECTION FUNCTIONS

The Power Supply Transfer device 7VU68 integrates protection functions for tie-CB in primary connection of Segmented Single Busbar. This function can be set “Enabled” or “Disabled” during configuration.

The protection include the following functions,
- Phase Over-current Protection
- Earth Over-current Protection
- Phase Over-current Protection for Busbar Energization
- Earth Over-current Protection for Busbar Energization

To secure the reliability and sensitivity, the voltage element is additionally introduced to current criterion to release trip command.

For functions of Phase Over-current Protection and Phase Over-current for Busbar Energization, compound voltage element is used. The criterion of compound voltage element is illustrated in Fig.37,

![Fig.37 Logic of compound voltage element](image)

For functions of Earth Over-current Protection and Earth Over-current Protection for Busbar Energization, the element of zero sequence over-voltage is used. The quantity is derived from calculated 3U0 based on measured busbar1 voltage.

The validity of protections in case of busbar energization can be set under parameter 9019A “Active Time for Busbar Energization”.

Each of above functions can be separately switched “ON” or “OFF” remotely via communication or locally at device panel.

Phase Over-current Protection

This function is designed to detect any short-circuit faults in MV system. The device will evaluate all current inputs at channel I_B and will pickup immediately if one of phase current over-shots the settable threshold.

The function has two stages, one time delay for each stage.

Earth Over-current Protection

This function is designed to detect earth fault in MV system. The device will evaluate zero sequence current and will pickup immediately if it over-shots the settable threshold.

The quantity of zero sequence current be derived from calculated 3I0 or measured earth current Ie. This can be set under parameter 9018 “3I0/Ie Assignment”.

The function has two stages, one time delay for each stage.

Earth Over-current Protection for Busbar Energization

The function Earth Over-current Protection can be activated for some time after the busbar is energized when tie-CB is closed. An individual function Earth Over-current Protection for Busbar Energization is specially designed for this utilization.

The function has the same criterion and stages to Earth Over-current Protection. The function will not be activated until the tie-CB is closed.
### SELECTION AND ORDERING CODE

| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 |
|---|---|---|---|---|---|---|---|---|----|----|----|----|----|----|
| 7 | V | U | 6 | 8 | E | 1 | A | A | 0 |

Multi-functional Power Supply Transfer Device 7VU68

### Use Case
- **ATS 17BI/18BO**: 1
- **HSBT 17BI/18BO (include 5HS)**: 3

### CT Secondary Rated Current
- In = 1A<sup>1)</sup> 1
- In = 5A<sup>1)</sup> 5

### Auxiliary Voltage (Power Supply/Pickup Threshold BI)
1. 24-48V DC, BI threshold 17V DC<sup>3)</sup> 2
2. 60-125V DC<sup>2)</sup>, BI threshold 17V DC<sup>3)</sup> 4
3. 110-250V DC<sup>2)</sup>, 115-230V AC, BI threshold 73V DC<sup>3)</sup> 5
4. 220-250V DC<sup>2)</sup>, 115-230V AC, BI threshold 154V DC<sup>3)</sup> 6

### Construction
- Flush mounting with screw terminals

### Region Specific Default / Language Settings
- **World, English<sup>4)</sup>, 50/60Hz**: B
- **China, Chinese<sup>4)</sup>, 50/60Hz**: W

### Port B (System)
- None 0
- IEC 61870-5-103 protocol, electrical RS232 1
- IEC 61870-5-103 protocol, electrical RS485 2
- IEC 61870-5-103 protocol, optical 820nm, ST connector 3
- Profibus DP Slave, electrical RS485 9
- Profibus DP Slave, optical 820 nm, double ring, ST connector 9
- Modbus, electrical RS485 9
- Modbus, optical 820 nm, ST connector 9
- IEC 60870-5-103 protocol, redundant electrical, RJ45 connector 9
- IEC 61850, 100 Mbit Ethernet, redundant electrical, RJ45 connector 9
- IEC 61850, 100 Mbit Ethernet, optical, LC connector, 1300nm, multi-mode 9

### Port C (Service)
- DIGSI 4/modem, electrical RS232 1
- DIGSI 4/modem, electrical RS485 2

### Measurement
- Basic measured values 1

### Functions
- **Power Supply Transfer (ATS 7VU681 / HSBT 7VU683)**
- **Protection (Ph. O/C, Earth O/C, Ph. O/C Energiz., Earth O/C Energiz.)**
- **Supervision**
